### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

The product reacts with metals with evolution of highly flammable hydrogen. The acid reacts violent with alkalies with evolution of heat.

#### 10.4 Conditions to avoid

Any use involving aerosol formation or vapor release in excess of 0,05 mg/m³ where workers are exposed without respiratory protection. Any use carrying a risk of splashes to eyes / skin where workers are exposed without eye/skin protection

#### 10.5 Incompatible materials

Metals, oxidant, alkali, hydrochloric acid

#### 10.6 Hazardous decomposition products

Sulphur oxides / Hydrogen.

#### 11. TOXICOLOGICAL INFORMATION

#### 11.1 Information on toxicological effects

The substance is a strong, highly corrosive acid. The substance only causes local effects and no systemic effects. It rapidly dissociates almost completely in contact with water, releasing the sulphur ion and the hydrogen ion which combines with water to form the hydronium ion. Both sulphur and hydronium ions are normally present in the body.

| Inhibition of microbial activity:       | No available data                                                                                                                                                                                                                                                                                                                                            |  |  |  |
| 12.2 Persistence and degradability      |                                                                                                                                                                                                                                                                                                                                                              |  |  |  |
| Biodegradation:                         | As the active substance, is an inorganic compound, which is not biologically degradable, the ready biodegradability, inherent biodegradability and biodegradation in seawater are scientifically impossible to perform.                                                                                                                                      |  |  |  |

## **SAFETY DATA SHEET**

|                                                                                                                                                                                                               | In addition, the proposed use of sulphuric acid is not expected to lead to significant releases to marine water.                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hydrolysis:                                                                                                                                                                                                   | Due to its intrinsic properties, it is scientifically impossible to perform a hydrolysis test. In addition, since the behaviour of sulphuric aci in water is known, it is also not scientifically necessary                                                                                         |
| 12.3 Bioaccumulative potential                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                     |
| Bioconcentration factor (BCF):                                                                                                                                                                                | No bioaccumulation expected.                                                                                                                                                                                                                                                                        |
| 12.4 Mobility in soil                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                     |
| Adsorption coefficient:                                                                                                                                                                                       | Terrestrial compartment is not expected to be relevant. If emitted to soil, adsorption to soil particles will be negligible. Depending on the buffer capacity of the soil, H <sup>+</sup> will be neutralized in the soil pore water by natural organic or inorganic matter or the pH may decrease. |
| Persistence Assessment                                                                                                                                                                                        | to be classified as a PBT or vPvB substance                                                                                                                                                                                                                                                         |
| Persistence Assessment The substance can be regarded as non classification are met. Bioaccumulation Assessment The substance is considered cationic at bioaccumulation potential  13. DISPOSAL CONSIDERATIONS | biodegradable in the aquatic and terrestrial environment. The test results suggest that the substance is persistent. Therefore the criteria for the P environmental pH levels, the log Kow was calculated to a value of -1. Following the Annex VIII Guidance this value does not impose any        |
| Persistence Assessment The substance can be regarded as non classification are met. Bioaccumulation Assessment                                                                                                | biodegradable in the aquatic and terrestrial environment. The test results suggest that the substance is persistent. Therefore the criteria for the P                                                                                                                                               |

#### 15. REGULATORY INFORMATION

15.1 Safety, health and environmental regulation/legislation specific for the substance or mixture:

15.2 Chemical safety assessment:

Chemical Safety Assessments have been carried out for these substances.

#### 16. OTHER INFORMATION

The information provided in this safety data sheet is correct to the best of our knowledge, information, and belief at the date of its publication. The information given is designed only as guidance for safe handling, use, processing, storage, transportation, disposal, and release and is not to be considered a warranty or quality specification. The information relates only to the specific material designated and may not be valid for such material used in combination with any other materials or in any proceed, unless specified in the text.

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

#### ANNEX

#### **Exposure scenarios**

#### ES1Production of sulphur trioxide

Sector of Use:

SU3: Industrial uses: Uses of substances as such or in preparation at industrial sites

Produce Category: Not applicable

**Process Categories:** 

PROC01: Use in closed process, no likelihood of exposure

PROC02: Use in closed, continuous process with occasional controlled exposure

PROC08b: Transfer of substance or preparation (charging/discharging) from/to vessels/large containers at dedicated facilities

PROC09: Transfer of substance or preparation into small containers (dedicated filling line, including weighing)

Environmental Release Category: ERC01: Manufacture of Substances

Operational conditions related to frequency, duration and amount of use

The production of sulphur trioxide is generally a continuous/batch production, with the process running for long periods without interruption, for up to 360 days per year. Operators work a standard shift and normal working week, with production continuing at weekends. Planned maintenance and shutdowns occur only every few years. Duration, frequency and amounts

| Information type                                                    | Data field                       | Explanation                                                                                                             |
|---------------------------------------------------------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Use amount per worker<br>[workplace] per day                        | No data                          | Worker exposure considered to be negligible due to the specialised systems and closed nature of the production process. |
| Duration per day at workplace [for one worker]                      | 8hr/d                            | Standard number of hours in one work day                                                                                |
| Frequency at workplace [for one worker]                             | 220 d/y                          | Standard number of work days / year                                                                                     |
| Other determinants related to duration, frequency and amount of use | Intermittent contact is expected | These tasks rarely take a full 8hr / day so worst case is assumed.                                                      |
| Annual amount used per site                                         | 60,000 t/y                       | Worst case for single production site                                                                                   |
| Emission days per site                                              | 360 d/y                          | Estimate number of emission days, based on continuous production                                                        |

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

#### Risk management measures

Exhaust gasses from the incineration process can be filtered and scrubbed; typically this removes >99% of sulphur oxide gases with the outflow being continually analysed for sulphide gas content which would generally be sulphur dioxide rather than sulphur trioxide.

Workers involved in production, handing, sampling and transfer of materials are trained in the procedures and protective equipment is intended to cope with the worst case scenario, in order to minimise exposure and risks. This may include chemical resistant clothing, goggles and respiratory equipment where required. Due to the nature of the materials the level of control and system closure is extremely high and so in reality exposure is highly unlikely. Primary emission sources are not located in the breathing zone of the worker as workers are in a separate control room. The handling of sulphur trioxide is such that contact between product and adjacent air is reduced and controlled loading is used reducing the amount of aerosol formation. Vapour recovery systems and local exhaust ventilation such as enclosing hoods are used where required. Emission sources are completely segregated from the work environment by isolating the source in a fully enclosed and separate room and there is complete personal enclosure with ventilation where necessary. The processes are generally fully enclosed (air tight) and the integrity of the enclosure is monitored. The facilities are housed outdoors, not close to buildings and workers are generally located > 4 metres from far field source.

Environmental emissions are limited by designated waste treatment process designed to limit environmental exposure to all relevant compartments. Waste gas emissions are scrubbed and may also then be diverted to the wastewater stream. This significantly lessens the possible emission by atmospheric deposition to soil or surface waters. Liquid wastes would generally contain sulphuric acid that has formed when sulphur trioxide contacts water and these converted wastes are treated (neutralisation to neutral pH) prior to emission to remove any sulphuric acid in the waste water and sludge from the waste water treatment plant is sent for incineration or landfill and is not used for agricultural spreading. This precludes any contamination of soil by sludge spreading. Waste water treatment is usually carried out by neutralisation followed by flocculation or decantation. Risk management measures for industrial site

### **SAFETY DATA SHEET**

## In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

| Information type                                                                                               | Data field                                | Explanation                                                                                                                                                                                                                                   |  |
|----------------------------------------------------------------------------------------------------------------|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|                                                                                                                | onsite STP.                               | municipal STP or to the environment.                                                                                                                                                                                                          |  |
| Resulting fraction of initially applied amount in waste water released from site to the external sewage system | Varies depending on system.               | The neutralisation process is extremely efficient and pH monitors are in place to ensure that complete<br>neutralisation and removal have taken place. Complete conversion of sulphur trioxide to sulphuric acid<br>waste stream is expected. |  |
| Air emission abatement                                                                                         | Effectiveness: Adequate measures in place | Exhaust gases from the production treated by scrubbers.                                                                                                                                                                                       |  |
| Onsite waste treatment                                                                                         | Effectiveness: complete                   | The waste water neutralisation process is extremely efficient with almost total neutralisation achieved. pH alarms are in place to ensure that successful neutralisation has taken place.                                                     |  |
| Effluent (of the waste water treatment plant) discharge rate                                                   | 2000 m <sup>3</sup> /d                    | Default: 2.000 m <sup>3</sup> /d                                                                                                                                                                                                              |  |
| Recovery of sludge for agriculture or horticulture                                                             | No                                        | All sludge is collected and incinerated or sent to landfill.                                                                                                                                                                                  |  |
| Resulting fraction of initially applied amount in waste water released from site                               | Complete removal                          | In the second tier removal of formed sulphuric acid by neutralization has been considered.                                                                                                                                                    |  |

#### Workers exposure

The assessment of worker exposure to sulphur trioxide (and subsequent sulphuric acid mists in air) from production (ES1) was carried for processes relevant to this use scenario as identified by PROC codes. Initially, a screening-level (Tier 1) assessment was carried out using the ECETOC Targeted Risk Assessment (TRA) model. A higher tier (Tier 2) refinement of the Tier 1 assessment was carried out using the Advanced REACH Tool (ART).

Acute/short -term and long-term exposure

Parameters used in the ECETOC TRA model to conduct a Tier 1 assessment of inhalation exposure concentrations

|                               | Parameter           | Explanation/source of data                                                                                                              |
|-------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Molecular weight              | 80.06 g/mol         |                                                                                                                                         |
| Vapour Pressure               | 9730 Pa             |                                                                                                                                         |
| Water solubility              | 10000 mg/L          | Representative value used in modelling as sulphur trioxide rapidly hydrolyses in water to form sulphuric acid which is highly miscible. |
| Is the substance a solid?     | No – liquid         |                                                                                                                                         |
| Dustiness during process      | n/a                 | Only in the case of solid                                                                                                               |
| Duration of activity          | >4 hours (default)  |                                                                                                                                         |
| Use of ventilation            | Indoors with LEV    |                                                                                                                                         |
| Use of respiratory protection | Yes, 95% efficiency |                                                                                                                                         |

## **SAFETY DATA SHEET**

## In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

First tier screening level exposure concentrations to workers

| Description of activity                                  | PROC | Physical state of material | Estimated Exposure Concentrations |                   |
|----------------------------------------------------------|------|----------------------------|-----------------------------------|-------------------|
|                                                          |      |                            | value                             | unit              |
| Production                                               | 1    | Liquid                     | 1.67 x10 <sup>-03</sup>           | mg/m <sup>3</sup> |
| (High integrity closed system, sampling via closed loop) |      |                            |                                   |                   |
| Production and sampling                                  | 2    | Liquid                     | 1.67 x10 <sup>-01</sup>           | mg/m <sup>3</sup> |
| (Occasional exposure system)                             |      |                            |                                   |                   |
| Loading/transfer                                         | 8b   | Liquid                     | 2.50 x10 <sup>-01</sup>           | mg/m <sup>3</sup> |
| Loading/transfer (Small containers)                      | 9    | Liquid                     | 8.34 x10 <sup>-01</sup>           | mg/m <sup>3</sup> |

Parameters and assumptions used in the ART model to conduct a Tier 2 assessment of inhalation exposure concentrations

| ·                                 | PROC        | Parameters/ assumptions                                                                                                                                                                         |  |  |  |
|-----------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|--|
| Exposure duration                 | All         | 480 min                                                                                                                                                                                         |  |  |  |

#### Consumer exposure

Consumers are not directly exposed to sulphur trioxide during the processes associated with ES1 as this exposure scenario involves only closed industrial processes. Indirect exposure of humans via the environment (oral)

Indirect exposure of humans via the environment is expected to be negligible. Sulphur trioxide converts to sulphuric acid upon contact with environmental moisture. This sulphuric acid is fully miscible in water and, as such, will not persist in any environmental compartment where indirect exposure of humans could occur. Furthermore none of the processes associated with sulphur trioxide production involve any targeted environmental emissions or application and the primary receiving compartment is the on-site STP where rigorous neutralisations processes and employed. Removal in the STP is expected to be efficient and so secondary exposure of the other receiving compartments is expected to be minimal. Similarly contamination of food crops or animals used as human food sources is not envisaged. Environmental exposure

EUSES inputs for production of sulphuric acid

| Input parameter:           | Value: | Unit: | ERC default (if applicable) |
|----------------------------|--------|-------|-----------------------------|

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

#### ES 2: Use of sulphur trioxide as an Intermediate

Sector of Use:

SU3: Industrial uses: Uses of substances as such or in preparation at industrial sites SU8: Manufacture of bulk, large scale chemicals (including petroleum products)

SU9: Manufacture of fine chemicals

Produce Category: PC19: Intermediate

**Process Categories:** 

PROC01: Use in closed process, no likelihood of exposure

PROC02: Use in closed, continuous process with occasional controlled exposure

PROC03: Use in closed batch process (synthesis or formulation)

PROC04: Use in batch and other process (synthesis) where opportunity for exposure arises

PROC08b: Transfer of substance or preparation (charging/discharging) from/to vessels/large containers at dedicated facilities

PROC09: Transfer of substance or preparation into small containers (dedicated filling line, including weighing)

**Environmental Release Category:** 

ERC6A: Industrial use resulting in manufacture of another substance (use of intermediates)

#### Description of activities and processes covered in the exposure scenario

Generally intermediate use of sulphur trioxide is continuous with single site use rates ranging between 15 and around 30 tonnes per day in a large facility. The large size of the typical facility involved means that all vessels and reactors are housed out-doors, managed by a small number of operators working in a separate enclosed control room.

Because of the conditions required (such as high temperatures) in the processes (and the nature of sulphur trioxide and the produced gases) all reactors and pipelines are sealed and insulated, to prevent loss of the reaction materials and maintain the necessary temperatures, and to protect the workforce and the environment.

All processes are very highly contained. Most facilities dealing with sulphur trioxide, in all relevant process types, are large-scale outdoor plants.

Road tanker connecting and disconnecting (loading and unloading) generally takes place in the open air with completely sealed systems. Loading and unloading of tankers with sulphur trioxide for use as an intermediate is performed in the open air. Workers wear protective clothing (face/eye protection, helmet, anti-acid gloves boots and protective overall). A safety shower is required nearby in case of accidental spillage. Gas displacement lines are also used if filling of road tankers takes place under cover. If respiratory protection is required then it is used. For each subsequent industrial ES the same general routes of exposure as for production are relevant. In all cases the risk of worker exposure, as determined for each PROC, will be governed by the same exposure routes as production in many cases. For the environmental assessment the risk the emission levels (fractions) for each ES will be dictated by the relevant ERC however the routes of environmental exposure will remain the same with the majority of the emissions being

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

directed to the air (though they will be mostly removed by scrubbers) or to the liquid waste stream and to STP where conversion to sulphuric acid and neutralization will occur. **Operational conditions related to frequency, duration and amount of use** 

The intermediate use of sulphur trioxide is generally a continuous/batch production, with the process running for long periods without interruption, for up to 360 days per year. Operators work a standard shift and normal working week, with activity continuing at weekends.

#### Operational conditions related to available dilution capacity and characteristics of exposed humans

Respiration volume and skin contact under conditions of worker uses

| Information type | Data field | Explanation |
|------------------|------------|-------------|
|                  |            |             |

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

| Respiration volume under conditions of | 10m <sup>3</sup> /d                 | Default value for a worker breathing for a 8hrs work day in RIP 3.2                              |
|----------------------------------------|-------------------------------------|--------------------------------------------------------------------------------------------------|
| use                                    |                                     |                                                                                                  |
| Skin contact area with the substance   | 480cm <sup>2</sup> (ECETOC default) | Please note that due to the corrosive nature of sulphuric acid dermal exposure is not considered |
| under conditions of use                |                                     | relevant for risk characterisation as it must be prevented in all cases.                         |

#### Conditions leading to dilution of initial release related to human health

| Information type               | Data field | Explanation                                                                                                                             |
|--------------------------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Room size and ventilation rate | N/A        | Not relevant as workers involved in production work in a control room, with no direct contact to the installations housing the material |

#### Conditions leading to dilution of initial release related to environment

| Information type                                                  | Data field               | Explanation                                                               |
|-------------------------------------------------------------------|--------------------------|---------------------------------------------------------------------------|
| Discharge volume of sewage treatment plant                        | 2000 m <sup>3</sup> /d   | EUSES default value for standard local STP                                |
| Available river water volume to receive the emissions from a site | 20,000 m <sup>3</sup> /d | Standard ERC flow rate leading to a 10 fold dilution in receiving waters. |

#### Risk management measures

Waste gasses are minimised and can be filtered and scrubbed if required typically this removes >99% of sulphur oxides. This removal has not been taken into account in the assessment below and so should be considered to be worst case.

Workers involved in processing, handing, sampling and transfer of materials are trained in the procedures and protective equipment is intended to cope with the worst case scenario, in order to minimise exposure and risks. This may include chemical resistant clothing, goggles and respiratory equipment where required. Due to the nature of the materials the level of control and system closure is extremely high and so in reality exposure is highly unlikely. Primary emission sources are not located in the breathing zone of the worker as workers are in a separate control room. The handling of sulphur trioxide is such that contact between product and adjacent air is reduced and controlled loading is used reducing the amount of aerosol formation. Vapour recovery systems and local exhaust ventilation such as enclosing hoods are used. Emission sources are completely segregated from the work environment by isolating the source in a fully enclosed and separate room and there is complete personal enclosure with ventilation. The processes are fully enclosed (air tight) and the integrity of the enclosure is monitored. The facilities are housed outdoors, not close to buildings and workers are generally located > 4 metres from far field source.

Environmental emissions are limited by designated waste treatment process designed to limit environmental exposure to all relevant compartments. Waste gas emissions are

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

scrubbed and may also then be diverted to the wastewater stream. This significantly lessens the possible emission by atmospheric deposition to soil or surface waters. Liquid wastes would generally contain sulphuric acid that has formed when sulphur trioxide contacts water and these converted wastes are treated (neutralisation to neutral pH) prior to emission to remove any sulphuric acid in the waste water and sludge from the waste water treatment plant is sent for incineration or landfill and is not used for agricultural spreading. This precludes any contamination of soil by sludge spreading. Waste water treatment is usually carried out by neutralisation followed by flocculation or decantation.

Risk management measures for industrial site

| Information type                                                                                               | Data field                       | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |  |

|                                                                                  |                         |                                                                                                                                                                                           |
| Onsite waste treatment                                                           | Effectiveness: complete | The waste water neutralisation process is extremely efficient with almost total neutralisation achieved. pH alarms are in place to ensure that successful neutralisation has taken place. |
| Effluent (of the waste water treatment plant) discharge rate                     | 2000 m <sup>3</sup> /d  | Default: 2.000 m <sup>3</sup> /d                                                                                                                                                          |
| Recovery of sludge for agriculture or horticulture                               | No                      | All sludge is collected and incinerated or sent to landfill.                                                                                                                              |
| Resulting fraction of initially applied amount in waste water released from site | Complete removal        | In the second tier removal of formed sulphuric acid by neutralization has been considered.                                                                                                |

## Exposure estimation Workers exposure

The assessment of worker exposure to sulphur trioxide used as an intermediate in the manufacture of sulphuric acid, organic and inorganic chemicals (ES 2) was carried for processes relevant to this use scenario as identified by PROC codes. Initially, a screening-level (Tier 1) assessment was carried out using the ECETOC Targeted Risk Assessment (TRA) model. A higher tier (Tier 2) refinement of the Tier 1 assessment was carried out using the Advanced REACH Tool (ART).

#### Acute/short -term and long-term exposure

Parameters used in the ECETOC TRA model to conduct a Tier 1 assessment of inhalation exposure concentrations

|                               | Parameter           | Explanation/source of data                                                                                                              |
|-------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Molecular weight              | 80.06 g/mol         |                                                                                                                                         |
| Vapour Pressure               | 9730 Pa             |                                                                                                                                         |
| Water solubility              | 10000 mg/L          | Representative value used in modelling as sulphur trioxide rapidly hydrolyses in water to form sulphuric acid which is highly miscible. |
| Is the substance a solid?     | No – liquid         |                                                                                                                                         |
| Dustiness during process      | n/a                 | Only in the case of solid                                                                                                               |
| Duration of activity          | >4 hours (default)  |                                                                                                                                         |
| Use of ventilation            | Indoors with LEV    |                                                                                                                                         |
| Use of respiratory protection | Yes, 95% efficiency |                                                                                                                                         |

#### Consumer exposure

Consumers are not directly exposed to sulphur trioxide during the processes associated with ES1 as this exposure scenario involves only closed industrial processes. **Indirect exposure of humans via the environment (oral)** 

#### **Environmental exposure**

Intermediate use of sulphur trioxide is generally a continuous process with constant production and use throughout the year. Facilities may generally utilise sulphur trioxide at

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

up to 360 days per year.

First tier conservative environmental exposure estimations were carried out using EUSES 2.1 and using the specified defaults. ERC 6A was used to determine the environmental emissions for intermediate use in the first tier with more realistic refined inputs chosen for second tier assessment. Second tier worst case environmental exposure estimations were carried out using EUSES 2.1 to take into account more realistic factors that affect the environmental concentrations and partitioning including degradation and sorption parameters. As the tier 1 assessment was not considered to give a reasonable or satisfactory assessment only the results of the second tier assessment has been shown below.

#### **Environmental releases**

| 6A  | Aquatic<br>freshwater (after<br>STP) | 833kg/d            | -                | Predicted values are those calculated by EUSES using the tonnage data and defaults for ERC6A. |
|     | Release to air                       | 2,080 kg/d         | -                | Predicted values are those calculated by EUSES using the tonnage data and defaults for ERC6A  |
|     | Soil (direct only) Agricultural soil | 0 kg/d             | -                | No directly loss to soil is expected for this ERC and no sludge spreading.                    |

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

#### ES 3: Use of oleum as a nitration agent

Sector of Use:

SU3: Industrial uses: Uses of substances as such or in preparation at industrial sites SU8: Manufacture of bulk, large scale chemicals (including petroleum products)

SU9: Manufacture of fine chemicals

Produce Category:

PC20: Products such as ph-regulators, flocculants, precipitants, neutralization agents

PC21: Laboratory chemicals

#### **Process Categories:**

PROC01: Use in closed process, no likelihood of exposure

PROC02: Use in closed, continuous process with occasional controlled exposure

PROC03: Use in closed batch process (synthesis or formulation)

PROC04: Use in batch and other process (synthesis) where opportunity for exposure arises

PROC08b: Transfer of substance or preparation (charging/discharging) from/to vessels/large containers at dedicated facilities

PROC09: Transfer of substance or preparation into small containers (dedicated filling line, including weighing)

PROC15: Use as laboratory reagent

Environmental Release Category:

ERC06b: Industrial use of reactive processing aids

#### Description of activities and processes covered in the exposure scenario

For ES3 the processes utilising sulphur trioxide as a component in nitrating agents are in principle similar to the processes for previous exposure scenarios with regards to the degree of control and system closure. The processes associated with this exposure scenario would generally take place in large commercial industrial laboratories and the large size of the typical facility involved means that all processes are carried out in a controlled environment by highly trained workers with high levels of exposure limiting measures and containment in place. Furthermore waste capture strategies including the use of flow hoods with gaseous removal and dedicated effluent capture treatment facilities are generally employed.

It is expected that should such operations be carried out sufficient emission and exposure control measures are put in place to protect those carrying out the laboratory work and Page 29 of 29

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

the environment.

#### Operational conditions related to frequency, duration and amount of use

The industrial scale laboratory use of sulphur trioxide as a component of nitrating agents may run as a continuous process with up to 330 days utilisation per year. Laboratory workers can be considered work a standard shift and normal working week thought actual exposure time to sulphur trioxide would be significantly less than the total time spent in the laboratory.

Duration, frequency and amounts

| Information type                        | Data field                  | Explanation                                |

### **SAFETY DATA SHEET**

## In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

| Information type                      | Data field              | Explanation                                                                                                                         |
|---------------------------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
|                                       |                         | tank container.                                                                                                                     |
| Physical state of product             | Liquid                  |                                                                                                                                     |
| Concentration of substance in product | Generally around 20-25% | Concentration in the nitration mixture is generally lower however formulations of 20-25% of sulphur trioxide are commonly supplied. |

#### Remarks or additional information:

Use of sulphur trioxide as a component in nitrating mixtures involves high integrity controlled systems with little or no potential for exposure. Pipelines and vessels are sealed. Laboratory workers are trained in the procedures and protective equipment is intended to cope with the worst case scenario, in order to minimise exposure and risks.

As described in previous exposure scenarios the handling of sulphur trioxide involves special equipment and highly specialised contained systems with little or no potential for exposure.

#### Risk management measures

Workers involved in the industrial laboratory use of sulphur trioxide as a nitrating agent component are generally highly trained with regards to the handling of the substance, proper segregation of the substance and the use of appropriate RPE and emission/exposure control measures. Protective equipment is intended to cope with the worst case scenario, in order to minimise exposure and risks. This may include chemical resistant clothing, goggles, vapour removal, substance segregation, system closure and respiratory equipment where required.

Environmental emissions are limited by designated waste treatment process designed to limit environmental exposure to all relevant compartments. General sulphide waste gas emissions are scrubbed and may also then be diverted to the wastewater stream. This significantly lessens the possible emission by atmospheric deposition to soil or surface waters. Liquid wastes are treated (neutralisation of the formed sulphuric acid to neutral pH) prior to emission to remove any sulphuric acid in the waste water and sludge from the waste water treatment plant is sent for incineration or landfill and is not used for agricultural spreading. This precludes any contamination of soil by sludge spreading. Waste water treatment is usually carried out by neutralisation followed by flocculation or decantation.

Risk management measures for industrial site

| Information type                             | Data field             | Explanation                                                                                                                                                                                                                                                                                                                                                                 |  |  |  |
|----------------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|--|
| Containment and local exhaust ventilation    |                        |                                                                                                                                                                                                                                                                                                                                                                             |  |  |  |
| Containment plus good work practice required | Effectiveness: Unknown | Handling of sulphur trioxide involves special equipment and high integrity contained systems with little or no potential for exposure. Facilities involved in the uses of sulphur trioxide are usually strictly contained. Any gas displaced from containers is conducted via pipeline to be processed i.e. removed and scrubbed and /or filtered to limit worker exposure. |  |  |  |

Exposure estimation Workers exposure

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

The assessment of worker exposure to sulphur trioxide used during the nitration of chemicals (ES 3) was carried for processes relevant to this use scenario as identified by PROC codes. Initially, a screening-level (Tier 1) assessment was carried out using the ECETOC Targeted Risk Assessment (TRA) model. A higher tier (Tier 2) refinement of the Tier 1 assessment was carried out using the Advanced REACH Tool (ART).

#### Acute/short -term and long-term exposure

Parameters used in the ECETOC TRA model to conduct a Tier 1 assessment of inhalation exposure concentrations

|                               | Parameter           | Explanation/source of data                                                                                                              |
|-------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Molecular weight              | 80.06 g/mol         |                                                                                                                                         |
| Vapour Pressure               | 9730 Pa             |                                                                                                                                         |
| Water solubility              | 10000 mg/L          | Representative value used in modelling as sulphur trioxide rapidly hydrolyses in water to form sulphuric acid which is highly miscible. |
| Is the substance a solid?     | No – liquid         |                                                                                                                                         |
| Dustiness during process      | n/a                 | Only in the case of solid                                                                                                               |
| Duration of activity          | >4 hours (default)  |                                                                                                                                         |
| Use of ventilation            | Indoors with LEV    |                                                                                                                                         |
| Use of respiratory protection | Yes, 95% efficiency |                                                                                                                                         |

Tier 1 inhalation exposure concentrations derived using the ECETOC TRA model

| Description of activity                                                                       | PROC | Physical state of material | Estimated<br>Concentration | stimated Exposure concentrations |  |
|-----------------------------------------------------------------------------------------------|------|----------------------------|----------------------------|----------------------------------|--|
|                                                                                               |      |                            | value                      | unit                             |  |
| Production                                                                                    | 1    | Liquid                     | 1.67 x10 <sup>-03</sup>    | mg/m <sup>3</sup>                |  |
| (High integrity closed system, sampling via closed loop)                                      |      |                            |                            |                                  |  |
| Production and sampling                                                                       | 2    | Liquid                     | 1.67 x10 <sup>-01</sup>    | mg/m <sup>3</sup>                |  |
| (Occasional exposure system)                                                                  |      |                            |                            |                                  |  |
| Production, transfer and sampling: Use of sulphuric acid in a closed batch                    | 3    | Liquid                     | 4.17 x10 <sup>-01</sup>    | mg/m <sup>3</sup>                |  |
| process                                                                                       |      |                            |                            |                                  |  |
| Production, transfer and sampling: Use of sulphuric acid in batch processes (exposure likely) | 4    | Liquid                     | 3.34 x10 <sup>-01</sup>    | mg/m <sup>3</sup>                |  |
| Loading/transfer: Loading and unloading a tanker (dedicated site)                             | 8b   | Liquid                     | 2.50 x10 <sup>-01</sup>    | mg/m <sup>3</sup>                |  |
| Loading/transfer (filling small containers with sulphuric acid)                               | 9    | Liquid                     | 8.34 x10 <sup>-01</sup>    | mg/m <sup>3</sup>                |  |
| Laboratory chemicals                                                                          | 15   | Liquids                    | 1.67 x10 <sup>-01</sup>    | mg/m <sup>3</sup>                |  |

#### Consumer exposure

Consumers are not directly exposed to sulphur trioxide during the activities covered under this exposure scenario as they are purely industrial and there is no direct release to consumers.

Indirect exposure of humans via the environment (oral)

### **SAFETY DATA SHEET**

## In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

Indirect exposure of humans via the environment is expected to be negligible. Sulphur trioxide converts to sulphuric acid upon contact with environmental moisture. This sulphuric acid is fully miscible in water and, as such, will not persist in any environmental compartment where indirect exposure of humans could occur. Furthermore none of the processes associated with sulphur trioxide production involve any targeted environmental emissions or application and the primary receiving compartment is the on-site STP where rigorous neutralisations processes and employed. Removal in the STP is expected to be efficient and so secondary exposure of the other receiving compartments is expected to be minimal. Similarly contamination of food crops or animals used as human food sources is not envisaged.

| 6B  | Release to air                          | 13.9kg/d           | -                | Predicted values are those calculated by EUSES using the tonnage data and defaults for ERC6B. No refinement needed. |
|     | Soil (direct only)<br>Agricultural soil | 0 kg/d             | -                | No directly loss to soil is expected for this ERC and no sludge spreading.                                          |

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

#### ES 4: Formulation of oleum

Sector of Use:

SU10: Formulation [mixing] of preparations and/or re-packaging (excluding alloys)

**Process Categories:** 

PROC01: Use in closed process, no likelihood of exposure

PROC08b: Transfer of substance or preparation (charging/discharging) from/to vessels/large containers at dedicated facilities

PROC09: Transfer of substance or preparation into small containers (dedicated filling line, including weighing)

Environmental Release Category:

ERC02: Formulation of preparations

#### Description of activities and processes covered in the exposure scenario

For ES4 the processes utilising sulphur trioxide in the manufacture of oleum are largely similar to those discussed for ES1 with regards to the degree of control and system closure. Generally the formulation process would be continuous with use levels ranging between 100 and 200 tonnes per day in a large facility. The large size of the typical facility involved means that all vessels and reactors are housed out-doors, managed by a small number of operators working in a separate enclosed control room.

Loading and unloading of tankers with oleum is usually performed in the open air. Workers wear protective clothing (face/eye protection, helmet, anti-acid gloves boots and protective overall). A safety shower is required nearby in case of accidental spillage. Gas displacement lines are also used if filling of road tankers takes place under cover. System containment and segregation is in place to ensure that exposure does not occur.

#### Operational conditions related to frequency, duration and amount of use

The industrial scale formulation of oleum is generally a continuous production process, running for long periods without interruption, for up to 360 days per year. Operators work a standard shift and normal working week, with production continuing at weekends.

Table 1:Duration, frequency and amounts

| Information type                          | Data field | Explanation                                                                                                                    |
|-------------------------------------------|------------|--------------------------------------------------------------------------------------------------------------------------------|
| Use amount per worker [workplace] per day | No data    | Worker exposure considered to be negligible due to the specialised systems and closed nature of the oleum formulation process. |

### **SAFETY DATA SHEET**

## In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

| Information type                                                    | Data field                       | Explanation                                                        |
|---------------------------------------------------------------------|----------------------------------|--------------------------------------------------------------------|
| Duration per day at workplace [for one worker]                      | 8hr/d                            | Standard number of hours in one work day                           |
| Frequency at workplace [for one worker]                             | 220 d/year                       | Standard number of work days / year                                |
| Other determinants related to duration, frequency and amount of use | Intermittent contact is expected | These tasks rarely take a full 8hr / day so worst case is assumed. |
| Annual amount used per site                                         | 75,000 t/y                       | Worst case for single production site                              |
| Emission days per site                                              | Up to 360                        | Estimate number of emission days, based on continuous production   |

### Operational conditions and risk management measures related to product characteristics

#### **Product Characteristics**

| Information type                           | Data field                                       | Explanation                                                  |
|--------------------------------------------|--------------------------------------------------|--------------------------------------------------------------|
| Type of product the information relates to | Substance in oleum                               | The product is in liquid form in a sealed tank container.    |
| Physical state of product                  | Liquid                                           |                                                              |
| Concentration of substance in product      | Produced SO <sub>3</sub> > 98 % in oleum 20 -25% | SO <sub>3</sub> is dissolved in sulphuric acid to form oleum |

#### Remarks or additional information:

Use of sulphur trioxide involves high temperatures (during the incineration of molten sulphur) and high integrity contained systems with little or no potential for exposure. Pipelines and vessels are sealed. Workers involved in production work in a separate control room, with no direct contact to the installations housing the material. Workers involved in sampling and transfer of materials to road tankers are trained in the procedures and protective equipment is intended to cope with the worst case scenario, in order to minimise exposure and risks.

Formulation and handling of sulphur trioxide involves specialized processes, special equipment and high integrity contained systems with little or no potential for exposure. Facilities involved in the production and uses of sulphur trioxide are usually housed outdoors. Any gas displaced from containers (which is normally not the case due to the high level of system closure) is conducted via pipeline to be processed i.e. removed and scrubbed and /or filtered. Note that there is direct consumer use of sulphuric acid.

### **SAFETY DATA SHEET**

In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

#### Risk management measures

Workers involved in formulation, handing, sampling and transfer of materials are trained in the procedures and protective equipment is intended to cope with the worst case scenario, in order to minimise exposure and risks. This may include chemical resistant clothing, goggles and respiratory equipment where required. There is a high degree of system closure. Primary emission sources are not located in the breathing zone of the worker as workers are in a separate control room. The handling of sulphur trioxide is such that contact between product and adjacent air is reduced and controlled submerged loading is used reducing the amount of aerosol formation. Vapour recovery systems and local exhaust ventilation such as enclosing hoods are used. Emission sources are completely segregated from the work environment by isolating the source in a fully enclosed and separate room and there is complete personal enclosure with ventilation. The processes are fully enclosed (air tight) and the integrity of the enclosure is monitored. The facilities are generally housed outdoors, not close to buildings and workers normally are located > 4 metres from far field source.

Environmental emissions are limited by designated waste treatment process designed to limit environmental exposure to all relevant compartments. Waste gas emissions are scrubbed and may also then be diverted to the wastewater stream. This significantly lessens the possible emission by air deposition to soil or surface waters. Liquid wastes are treated (neutralisation to neutral pH) prior to emission to remove any sulphuric acid in the waste water and sludge from the waste water treatment plant is sent for incineration or landfill and is not used for agricultural spreading. This precludes any contamination of soil by sludge spreading. Waste water treatment is usually carried out by neutralisation followed by flocculation or decantation.

Risk management measures for industrial site

| Risk management measures related to                                                                            | environmental emissions from in           | ndustrial sites                                                                                                                                                                                                                                |
| Onsite pre-treatment of waste water                                                                            | Chemical pre-treatment or onsite STP.     | Waste waters are generally treated on site by chemical neutralisation methods before release to the municipal STP or to the environment.                                                                                                       |
| Resulting fraction of initially applied amount in waste water released from site to the external sewage system | Varies depending on system.               | The neutralisation process is extremely efficient and pH monitors are in place to ensure that complete neutralisation and removal have taken place. Complete conversion of sulphur trioxide to sulphuric acid in the waste stream is expected. |
| Air emission abatement                                                                                         | Effectiveness: Adequate measures in place | Exhaust gases from the production treated by scrubbers.                                                                                                                                                                                        |
| Onsite waste treatment                                                                                         | Effectiveness: complete                   | The waste water neutralisation process is extremely efficient with almost total neutralisation achieved. pH alarms are in place to ensure that successful neutralisation has taken place.                                                      |
| Effluent (of the waste water treatment plant) discharge rate                                                   | 2000 m <sup>3</sup> /d                    | Default: 2.000 m <sup>3</sup> /d                                                                                                                                                                                                               |
| Recovery of sludge for agriculture or horticulture                                                             | No                                        | All sludge is collected and incinerated or sent to landfill.                                                                                                                                                                                   |
| Resulting fraction of initially applied amount in waste water released from site                               | Complete removal                          | In the second tier removal of formed sulphuric acid by neutralization has been considered.                                                                                                                                                     |

## Exposure estimation Workers exposure

The assessment of worker exposure to sulphur trioxide (and subsequent sulphuric acid mists in air) from production (ES4) was carried for processes relevant to this use scenario as identified by PROC codes. Initially, a screening-level (Tier 1) assessment was carried out using the ECETOC Targeted Risk Assessment (TRA) model. A higher tier (Tier 2) refinement of the Tier 1 assessment was carried out using the Advanced REACH Tool (ART).

Parameters used in the ECETOC TRA model to conduct a Tier 1 assessment of inhalation exposure concentrations

|                  | Parameter   | Explanation/source of data                                 |
|------------------|-------------|------------------------------------------------------------|
| Molecular weight | 80.06 g/mol |                                                            |
| Vapour Pressure  | 9730 Pa     |                                                            |
| Water solubility | 10000 mg/L  | Representative value used in modelling as sulphur trioxide |

### **SAFETY DATA SHEET**

## In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

|                               |                     | rapidly hydrolyses in water to form sulphuric acid which is highly miscible. |
|-------------------------------|---------------------|------------------------------------------------------------------------------|
| Is the substance a solid?     | No – liquid         |                                                                              |

Consumer exposure

### **SAFETY DATA SHEET**

### In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

Consumers are not directly exposed to sulphur trioxide during the processes associated with ES4 as this exposure scenario involves only closed industrial processes. **Indirect exposure of humans via the environment (oral)** 

Indirect exposure of humans via the environment is expected to be negligible. Sulphur trioxide converts to sulphuric acid upon contact with environmental moisture. This EUSES inputs

| Input parameter:                           | Value:                                                                                 | Unit:        | ERC default (if applicable)       |
|--------------------------------------------|----------------------------------------------------------------------------------------|--------------|-----------------------------------|

### **SAFETY DATA SHEET**

## In accordance with Regulation (EC) 1907/2006 (REACH), Annex II

For the tier 2 assessment of environmental releases the effects of several RMMs have been investigated.

RMMs and measured values for tier 2 assessment.

| Description of RMM           | Details                                    | Effect taken into account in EUSES                                                                                                                                                                         | Comments                                            |
|------------------------------|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| No loss to waste water       | 0 mg/L                                     | Lowering of concentration in STP effluent to 0 mg/L due to the conversion of sulphur trioxide to sulphuric acid and the very efficient neutralization process to remove sulphuric acid in the waste stream | Total neutralization to around pH 7.                |
| Emission and production days | 360 emission days per year                 | Increase emission days by 20%.                                                                                                                                                                             | Continuous production                               |
| Sludge removal               | Sludge removed to landfill or incinerated. | Concentration in soil due to sludge spreading set to 0.                                                                                                                                                    | No contamination of grassland or agricultural soil. |
